

## Low voltage stepper motor driver

Datasheet - production data

### Features

- Operating voltage: from 1.8 to 10 V
- Maximum output current: 1.3 A<sub>rms</sub>
- R<sub>DS(on)</sub> HS + LS = 0.4 Ω typ.
- Microstepping up to 1/256<sup>th</sup> of a step
- Current control with programmable off-time
- Full protection set
  - Non-dissipative overcurrent protection
  - Short-circuit protection
  - Thermal shutdown
- Energy saving and long battery life with standby consumption less than 80 nA

### Applications

Battery-powered stepper motor applications such as:

- Toys
- Portable printers
- Robotics
- Point of sale (POS) devices

### Description

The STSPIN220 is a stepper motor driver which integrates, in a small QFN 3 x 3 mm package, both control logic and a low R<sub>DS(on)</sub> power stage.

The integrated controller implements PWM current control with fixed OFF time and a microstepping resolution up to 1/256<sup>th</sup> of a step.

The device is designed to operate in battery-powered scenarios and can be forced into a zero-consumption state, allowing a significant increase in battery life.

The device offers a complete set of protection features including overcurrent, overtemperature and short-circuit protection.

## 2 Electrical data

### 2.1 Absolute maximum ratings

Table 1: Absolute maximum ratings

Symbol	Parameter	Test condition	Value	Unit
$V_S$	Supply voltage		-0.3 to 11	V
$V_{IN}$	Logic input voltage		-0.3 to 5.5	V
$V_{OUT} - V_{SENSE}$	Output-to-sense voltage drop		Up to 12	V
$V_S - V_{OUT}$	Supply-to-output voltage drop		Up to 12	V
$V_{SENSE}$	Sense pin voltage		-1 to 1	V
$V_{REF}$	Reference voltage input		-0.3 to 1	V
$I_{OUT,RMS}$	Continuous power stage output current (each bridge)		1.3	$A_{rms}$
$T_{j,OP}$	Operative junction temperature		-40 to 150	°C
$T_{j,STG}$	Storage junction temperature		-55 to 150	°C

### 2.2 Recommended operating conditions

Table 2: Recommended operating conditions

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
$V_S$	Supply voltage		1.8		10	V
$V_{IN}$	Logic input voltage		0		5	V
$V_{REF}$	Reference voltage input		0.1		0.5	V
$t_{INW}$	Logic inputs positive/negative pulse width		300			ns

## 2.3 Thermal data

Table 3: Thermal data

Symbol	Parameter	Conditions	Value	Unit
$R_{th(JA)}$	Junction to ambient thermal resistance	Natural convection, according to JESD51-2a <sup>(1)</sup>	57.1	°C/W
$R_{thJCtop}$	Junction to case thermal resistance (top side)	Simulation with cold plate on package top	67.3	°C/W
$R_{thJCbot}$	Junction to case thermal resistance (bottom side)	Simulation with cold plate on exposed pad	9.1	°C/W
$R_{thJB}$	Junction to board thermal resistance	According to JESD51-8 <sup>(1)</sup>	23.3	°C/W
$\psi_{JT}$	Junction to top characterization	According to JESD51-2a <sup>(1)</sup>	3.3	°C/W
$\psi_{JB}$	Junction to board characterization	According to JESD51-2a <sup>(1)</sup>	22.6	°C/W

**Notes:**

<sup>(1)</sup>Simulated on a 21.2x21.2 mm board, 2s2p 1 Oz copper and four 300 µm vias below exposed pad.

## 2.4 ESD protection

Table 4: ESD protection ratings

Symbol	Parameter	Test condition	Class	Value	Unit
HBM	Human body model	Conforming to ANSI/ESDA/JEDEC JS-001-2014	H2	2	kV
CDM	Charge device model	Conforming to ANSI/ESDA/JEDEC JS-002-2014	C2a	500	V

### 3 Electrical characteristics

Test conditions:  $V_S = 5\text{ V}$ ,  $T_j = 25\text{ °C}$  unless otherwise specified.

**Table 5: Electrical characteristics**

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
<b>Supply</b>						
$V_{Sth(ON)}$	$V_S$ turn-on voltage	$V_S$ rising from 0 V	1.45	1.65	1.79	V
$V_{Sth(OFF)}$	$V_S$ turn-off voltage	$V_S$ falling from 5 V	1.3	1.45	1.65	V
$V_{Sth(HYS)}$	$V_S$ hysteresis voltage			180		mV

R <sub>OFF</sub>	47 kΩ (t <sub>OFF</sub> ≈ 37 μs)

Figure 3: Typical application schematic

## 6 Functional description

The STSPIN220 is a stepper motor driver integrating a microstepping sequencer (up to 1/256<sup>th</sup> of a step), two PWM current controllers and a power stage composed of two fully-protected full-bridges.

### 6.1 Standby and power-up

The device provides a low consumption mode forcing the STBY\RESET input below the  $V_{STBYL}$  threshold.

When the device is in standby status, the power stage is disabled (outputs are in high impedance) and the supply to the integrated control circuitry is cut off. When the device exits the standby status, all of the control circuitry is reset to power-up condition.

### 6.2 Microstepping sequencer

The value of the MODEx inputs is latched at power-up and when the device exits the STBY condition. After this, the input value is unimportant and the MODE3 and MODE4 inputs start operating as step-clock and direction input.

The only exception is the MODE1 = MODE2 = LOW condition; in this case the system is forced into full-step mode. The previous condition is restored as soon as the MODE1 and MODE2 inputs switch to a different combination.

An example of mode selection is shown in [Figure 5](#).

At each STCK rising edge, the sequencer of the device is increased (DIR input high) or decreased (DIR input low) of a module selected through the MODEx inputs as listed in [Table 8](#).

The sequencer is a 10-bit counter that sets the reference value of the PWM current controller and the direction of the current for both of the H bridges.

**Table 8: Step mode selection through MODEx inputs**

MODE3 (STCK)	MODE4 (DIR)	MODE1	MODE2	Step mode
0	0	0	0	<b>Full-step</b>
0	0	0	1	1/32 <sup>nd</sup> step
0	0	1	0	1/128 <sup>th</sup> step
0	0	1	1	1/256 <sup>th</sup> step
0	1	0	0	<b>Full-step - 1/32<sup>nd</sup> step<sup>(1)</sup></b>
0	1	0	1	1/4 <sup>th</sup> step
0	1	1	0	1/256 <sup>th</sup> step
0	1	1	1	1/64 <sup>th</sup> step
1	0	0	0	<b>Full-step - 1/128<sup>nd</sup> step<sup>(1)</sup></b>
1	0	0	1	1/256 <sup>th</sup> step
1	0	1	0	1/2 step
1	0	1	1	1/8 <sup>th</sup> step
1	1	0	0	<b>Full-step - 1/256<sup>th</sup> step<sup>(1)</sup></b>

MODE3 (STCK)	MODE4 (DIR)	MODE1	MODE2	Step mode
1	1	0	1	1/64 <sup>th</sup> step
1	1	1	0	1/8 <sup>th</sup> step
1	1	1	1	1/16 <sup>th</sup> step

**Notes:**

(1) This driving mode is automatically bypassed by the MODE1 = MODE2 = 0 if it is kept after the device quit the standby condition.

**Figure 4: STCK and DIR timing**

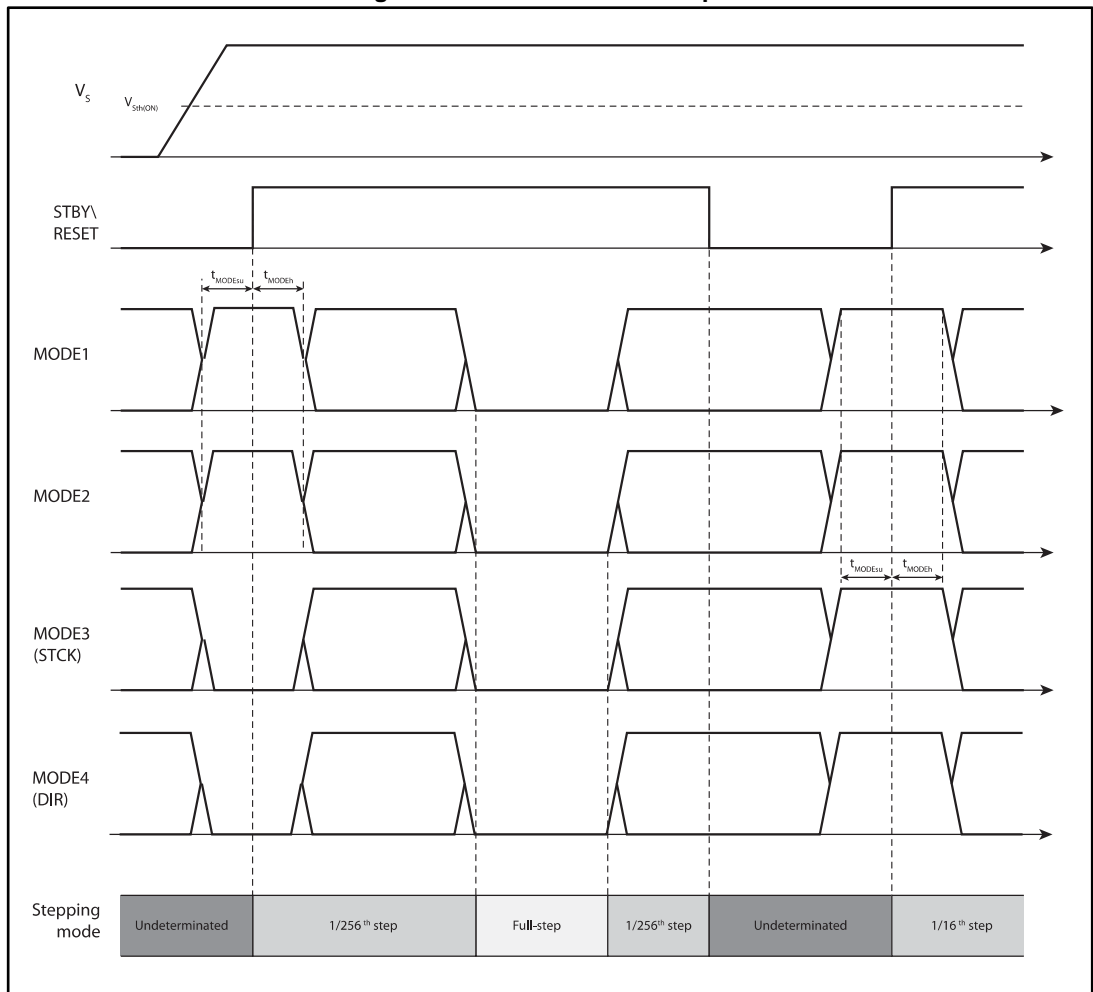

Figure 5: Mode selection example

When the full-step mode is set, the reference value of the PWM current controller and the direction of the current for both H bridges as listed in [Table 9](#).

Table 9: Target reference and current direction according to sequencer value (full-step mode)

Sequencer value										Phase A		Phase B	
										Reference voltage	Current direction	Reference voltage	Current direction
0	0	X	X	X	X	X	X	X	X	100% × V <sub>REF</sub>	A1 → A2	100% × V <sub>REF</sub>	B1 → B2
0	1	X	X	X	X	X	X	X	X	100% × V <sub>REF</sub>	A1 → A2	100% × V <sub>REF</sub>	B1 ← B2
1	0	X	X	X	X	X	X	X	X	100% × V <sub>REF</sub>	A1 ← A2	100% × V <sub>REF</sub>	B1 ← B2
1	1	X	X	X	X	X	X	X	X	100% × V <sub>REF</sub>	A1 ← A2	100% × V <sub>REF</sub>	B1 → B2

When the step mode is different from the full-step mode the values listed in [Table 10](#) are used.

**Table 10: Target reference and current direction according to sequencer value (not full-step mode)**

Sequencer value										Phase A		Phase B	
										Reference voltage	Current direction	Reference voltage	Current direction
0	0	0	0	0	0	0	0	0	0	Zero (power bridge disabled)	-	100% × V <sub>REF</sub>	B1 → B2
0	0	N								$\text{Sin}(N/256 \times \pi/2) \times V_{\text{REF}}$	A1 → A2	$\text{Cos}(N/256 \times \pi/2) \times V_{\text{REF}}$	B1 → B2
0	1	0	0	0	0	0	0	0	0	100% × V <sub>REF</sub>	A1 → A2	Zero (power bridge disabled)	-
0	1	N								$\text{Sin}(\pi/2 + N/256 \times \pi/2) \times V_{\text{REF}}$	A1 → A2	$\text{Cos}(\pi/2 + N/256 \times \pi/2) \times V_{\text{REF}}$	B1 ← B2
1	0	0	0	0	0	0	0	0	0	Zero (power bridge disabled)	-	100% × V <sub>REF</sub>	B1 ← B2
1	0	N								$\text{Sin}(N/256 \times \pi/2) \times V_{\text{REF}}$	A1 ← A2	$\text{Cos}(N/256 \times \pi/2) \times V_{\text{REF}}$	B1 ← B2
1	1	0	0	0	0	0	0	0	0	100% × V <sub>REF</sub>	A1 ← A2	Zero (power bridge disabled)	-
1	1	N								$\text{Sin}(\pi/2 + N/256 \times \pi/2) \times V_{\text{REF}}$	A1 ← A2	$\text{Cos}(\pi/2 + N/256 \times \pi/2) \times V_{\text{REF}}$	B1 → B2

The following table shows the target reference and sequencer values for 1/2-, 1/4- and 1/8-step operation. Higher microstepping resolutions follow the same pattern. The reset state (home state) for all stepping mode is entered at power-up or when the device exits the standby status.

**Table 11: Example**

1/2 step	1/4 step	1/8 step	VREF phase A	VREF phase B	Sequencer value
1	1	1	0%	100%	000000000 home state
		2	19.509%	98.079%	0000100000
	2	3	38.268%	92.388%	0001000000
		4	55.557%	83.147%	0001100000
2	3	5	70.711%	70.711%	0010000000
		6	83.147%	55.557%	0010100000
	4	7	92.388%	19.509%	0011100000
		8	98.079%	19.509%	0011100000
3	5	9	100%	0%	0100000000

1/2 step	1/4 step	1/8 step	VREF phase A	VREF phase B	Sequencer value
		10	98.079%	-19.509%	0100100000
	6	11	92.388%	-38.268%	0101000000
		12	83.147%	-55.557%	0101100000
4	7	13	70.711%	-70.711%	0110000000
		14	55.557%	-83.147%	0110100000
	8	15	38.268%	-92.388%	0111000000
		16	19.509%	-98.079%	1000100000
5	9	17	0%	100%	1000000000
		18	-19.509%	-98.079%	1000100000
	10	19	-38.268%	-92.388%	1001000000
		20	-55.557%	-83.147%	1001100000
6	11	21	-70.711%	-70.711%	1010000000
		22	-83.147%	-55.557%	1010100000
	12	23	-92.388%	-38.268%	1011000000
		24	-98.079%	-19.509%	1011100000
7	13	25	-100%	0%	1100000000
		26	-98.079%	19.509%	1100100000
	14	27	-92.388%	38.268%	1101000000
		28	-83.147%	55.557%	1101100000
8	15	29	-70.711%	70.711%	1110000000
		30	-55.557%	83.147%	1110100000
	16	31	-38.268%	92.388%	1111000000
		32	-19.509%	98.079%	1111100000

The positive number means that the output current is flowing from OUTx1 to OUTx2, vice versa for a negative value.

### 6.3 PWM current control

The device implements two independent PWM current controllers, one for each full bridge.

The voltage of the sense pins ( $V_{SENSEA}$  and  $V_{SENSEB}$ ) is compared to the respective internal reference generated based on the sequencer value (see [Table 9](#) and [Table 10](#)).

When  $V_{SENSEX} > V_{REFX}$ , the integrated comparator is triggered, the OFF time counter is started and the decay sequence is performed.

The decay sequence starts turning on both the low sides of the full bridge. When  $5/8^{\text{th}}$  of the programmed OFF time ( $t_{OFF,SLOW}$ ) has expired, the decay sequence performs a quasi-synchronous fast decay.

Table 12: ON, slow decay and fast decay states

Current direction <sup>(1)</sup>	ON	Slow decay	Fast decay (quasi-synch)
Zero (power bridge disabled)	HSX1 = OFF LSX1 = OFF HSX2 = OFF LSX2 = OFF	HSX1 = OFF LSX1 = OFF HSX2 = OFF LSX2 = OFF	HSX1 = OFF LSX1 = OFF HSX2 = OFF LSX2 = OFF
X1 → X2	<b>HSX1 = ON</b> LSX1 = OFF HSX2 = OFF <b>LSX2 = ON</b>	HSX1 = OFF <b>LSX1 = ON</b> HSX2 = OFF <b>LSX2 = ON</b>	HSX1 = OFF <b>LSX1 = ON</b> HSX2 = OFF LSX2 = OFF
X1 ← X2	HSX1 = OFF <b>LSX1 = ON</b> <b>HSX2 = ON</b> LSX2 = OFF	HSX1 = OFF <b>LSX1 = ON</b> HSX2 = OFF <b>LSX2 = ON</b>	HSX1 = OFF LSX1 = OFF HSX2 = OFF <b>LSX2 = ON</b>

**Notes:**

<sup>(1)</sup>The current direction is set according to [Table 9](#) and [Table 10](#).

The reference voltage value,  $V_{REF}$ , must be selected according to the load current target value (peak value) and sense resistor value.

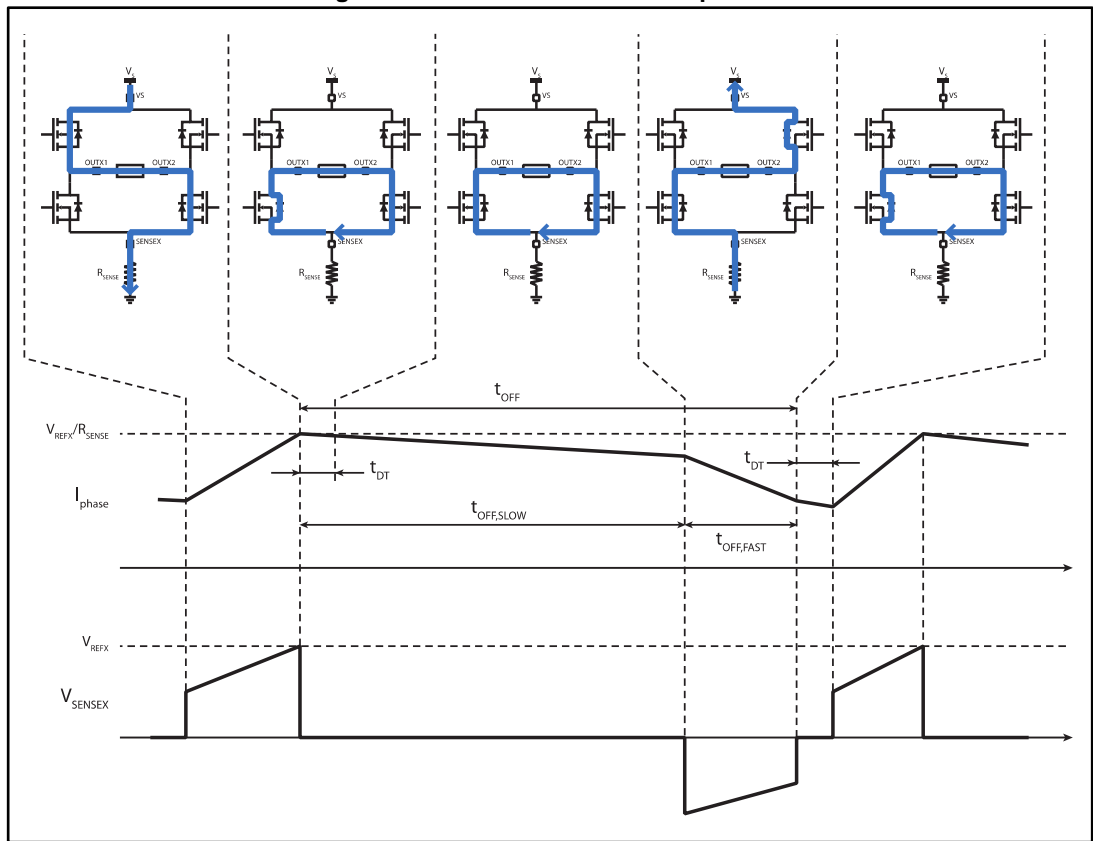

**Equation 1**

$$V_{REF} = R_{SNSx} \cdot I_{LOAD,peak}$$

In choosing the sense resistor value, two main issues must be taken into account:

- The sense resistor dissipates energy and provides dangerous negative voltages on the SENSE pins during current recirculation. For this reason the resistance of this component should be kept low (using multiple resistors in parallel will help to obtain the required power rating with standard resistors).
- The lower the  $R_{SNSx}$  value, the higher the peak current error due to noise on the  $V_{REF}$  pin and the input offset of the current sense comparator. Values of  $R_{SNSx}$  that are too low must be avoided.

Figure 6: PWM current control sequence

### 6.3.1 OFF time adjustment

The total OFF time (slow decay + fast decay) is adjusted through an external resistor connected between the TOFF pin and ground, as shown in [Figure 7](#). A small RC series must be inserted in parallel with the regulator resistor in order to increase the stability of the regulation circuit according to [Table 12](#) indications.

Figure 7: OFF time regulation circuit

The relationship between the OFF time and the external resistor value is shown in [Figure 8](#). The value typically ranges from 10  $\mu\text{s}$  to 150  $\mu\text{s}$ .

**Table 13: Recommended  $R_{RCOFF}$  and  $C_{RCOFF}$  values according to  $R_{OFF}$**

$R_{OFF}$	$R_{RCOFF}$	$C_{RCOFF}$
$10\text{ k}\Omega \leq R_{OFF} < 82\text{ k}\Omega$	1 k $\Omega$	22 nF
$82\text{ k}\Omega \leq R_{OFF} \leq 160\text{ k}\Omega$	2.2 k $\Omega$	22 nF

**Figure 8: OFF time vs.  $R_{OFF}$  value**

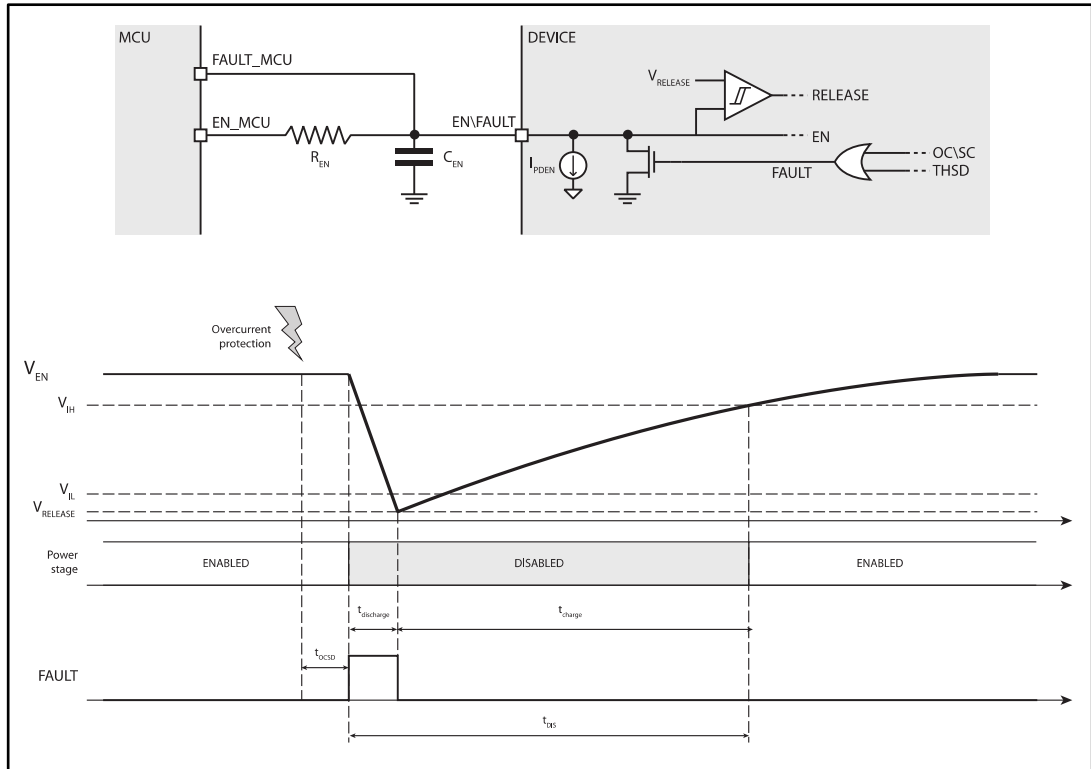

## 6.4 Overcurrent and short-circuit protection

The device embeds circuitry protecting each power output against overload and short circuit conditions (short to ground, short to  $V_S$  and short between outputs).

When the overcurrent or short-circuit protection is triggered, the power stage is disabled and the EN\FAULT input is forced low through the integrated open-drain MOSFET discharging the external  $C_{EN}$  capacitor (refer to [Figure 9](#)).

The power stage is kept disabled and the open-drain MOSFET is kept ON until the EN\FAULT input falls below the  $V_{RELEASE}$  threshold, then the  $C_{EN}$  capacitor is charged through the external  $R_{EN}$  resistor.

Figure 9: Overcurrent and short-circuit protection management

The total disable time after an overcurrent event can be set by properly sizing the external network connected to the EN\FAULT pin (refer to [Figure 9](#)):

**Equation 2**

$$t_{DIS} = t_{discharge} + t_{charge}$$

But  $t_{charge}$  is normally much higher than  $t_{discharge}$ , thus we can consider the following:

**Equation 3**

$$t_{DIS} \cong R_{EN} \cdot C_{EN} \cdot \ln \frac{(V_{DD} - R_{EN} \cdot I_{PDEN}) - V_{RELEASE}}{(V_{DD} - R_{EN} \cdot I_{PDEN}) - V_{IH}}$$

where  $V_{DD}$  is the pull-up voltage of the  $R_{EN}$  resistor.

Figure 10: Disable time versus  $R_{EN}$  and  $C_{EN}$  values (VDD = 3.3 V)

Figure 11: Disable time versus  $R_{EN}$  and  $C_{EN}$  values (VDD = 1.8 V)

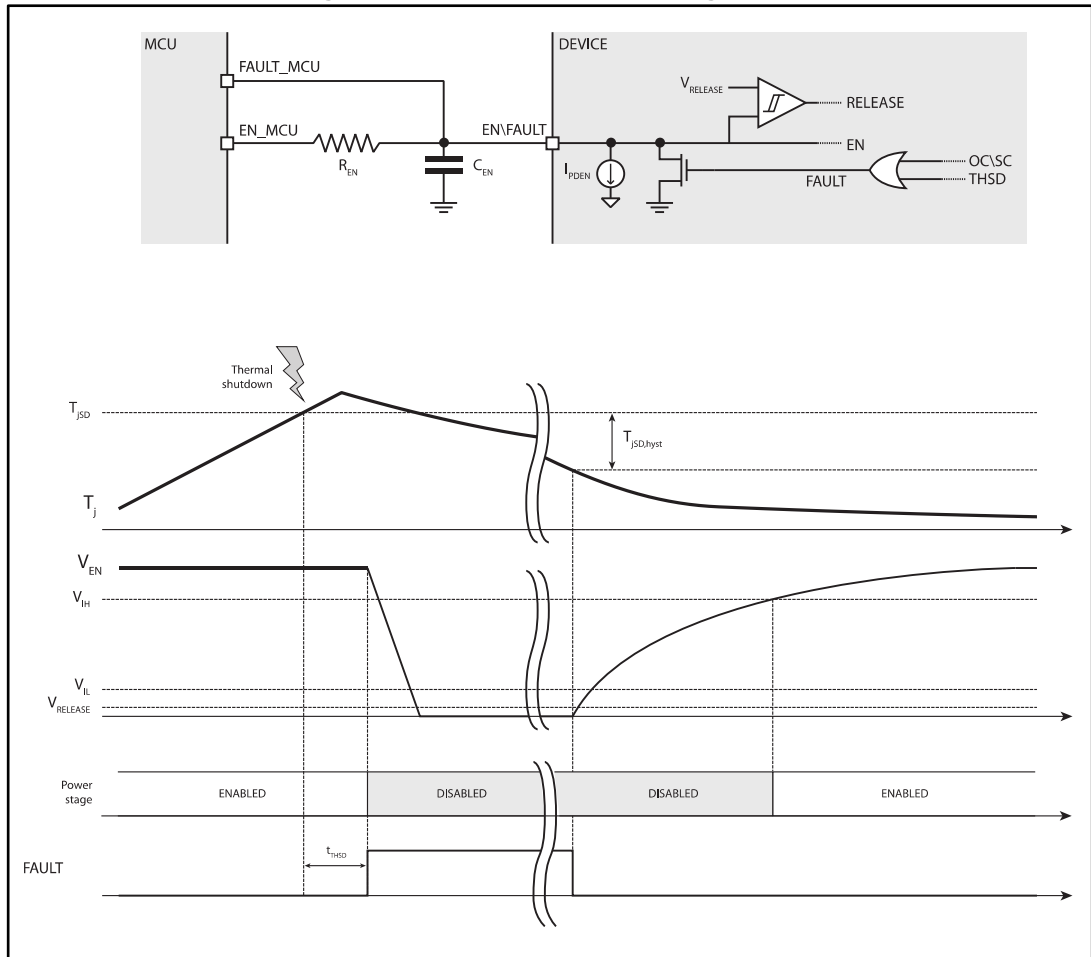

## 6.5 Thermal shutdown

The device embeds circuitry protecting it from overtemperature conditions.

When the thermal shutdown temperature is reached, the power stage is disabled and the EN\FAULT input is forced low through the integrated open-drain MOSFET (refer to [Figure 12](#)).

The protection and the EN\FAULT output are released when the IC temperature returns to a safe operating value ( $T_{jSD} - T_{jSD,Hyst}$ ).

## 8 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK® is an ST trademark.

### 8.1 VFQFPN 3x3x1.0 16L package information

Figure 16: VFQFPN 3x3x1.0 16L package outline

Table 14: VFQFPN 3x3x1.0 16L package mechanical data

Symbol	Dimensions (mm)			Notes
	Min.	Typ.	Max.	
A	0.80	0.90	1.00	(1)
A1		0.02		
A3		0.20		
b	0.18	0.25	0.30	
D	2.85	3.00	3.15	
D2	1.70	1.80	1.90	
E	2.85	3.00	3.15	
E2	1.70	1.80	1.90	
e		0.50		
L	0.45	0.50	0.55	

**Notes:**

(1)VFQFPN stands for "thermally-enhanced very thin fine pitch quad package, no lead". Very thin:  $0.80 < A \leq 1.00$  mm / Fine pitch:  $e < 1.00$  mm. The pin 1 identifier must be present on the top surface of the package as an indentation mark or other feature of the package body.
