

NCP5252

Buck Regulator - Integrated, Synchronous, Light Load Efficiency

2.0 A, 1.0 MHz

NCP5252 is a synchronous buck regulator with integrated high-side and low-side MOSFETs. The device is capable of operating from a 5 V or 12 V supply and can output a voltage down to 0.6 V. The switching frequency is adjustable from 333 kHz up to 1.0 MHz and has the ability to provide skip mode for light load efficiency. NCP5252 protection features include Under Voltage Lock Out (UVLO), Over Voltage Protection (OVP), Cycle-by-Cycle Current Protection (OCP) and Thermal Shutdown. The part is packaged in a 3x3 mm QFN-16.

Features

- 1% Accuracy 0.6 V Reference
- V_{CC} Voltage 4.5 V to 13.2 V
- Adjustable Output Voltage Range: 0.6 V to 5.0 V
- Transient Response Enhancement (TRE) Feature.
- Low Side Lossless Sense Current Control
- Input Voltage Feed Forward Control
- Internal Digital Soft-Start
- Integrated Output Discharge (Soft-Stop)
- Cycle-by-Cycle Current Limit
- Power Good Indication
- Overvoltage and Undervoltage Protection
- Thermal Shutdown Protection
- Power Saving Mode at Light Load
- Integrated Boost Diode
- QFN-16 (3 mm x 3 mm)
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- Desktop Application
- System Power
- XDSL, Modems, DC-DC Modules
- Set Top Box
- HD Driver
- LED Driver, DVD Recorders

PIN FUNCTION DESCRIPTION

Pin No	Symbol	Description
1	V _{CC}	Internal LDO power supply
2	BST	Top MOSFET driver input supply, place a ceramic capacitor between LX and BST.
3	PGOOD	Output voltage power good indication. The power good pin is an open drain indication flag. The PGOOD pin is low impedance if the output voltage is outside the comparator window and is high impedance if the output voltage is inside the comparator window.
4	EN/SKIP	The enable pin is used to enable the part and also set skip mode or forced PWM.
5	COMP	Output of the error amplifier
6	FB	Output voltage feedback
7	VO	Output voltage monitor
8	AGND	Analog ground
9	FREQ_SET	Frequency selection pin, 0 V = 333k, No connect = 500 kHz, 5 V = 1.0 MHz
10	V5	Output to the internal power supply for the analog circuitry
11-13	PGND	Ground reference and high-current return path for the bottom power MOSFET.
14-15	LX	Switch node between the top MOSFET and bottom MOSFET.
16	V _{CC}	High Side MOSFET input voltage connection
17	EPAD	Connect to PGND for thermal enhancement. Exposed pad is not electrically connected.

NCP5252

ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
V _{CC} Power Supply Voltage to AGND	V _{CC}	-0.3, 15	V
EN / SKIP to AGND	V _{EN}	-0.3, 6	V
Bootstrap Supply Voltage: BST to LX	V _{BST} - V _{LX}	-0.3, 15	V
LDO regulator: V5 to AGND	V5 - V _{AGND}	-0.3, 6	V
Input / Output Pins to AGND	V _{IO}	-0.3, 6	V
Switch Node to PGND	V _{LX}	15 20 (50 ns) -1 (DC) -5 (200 ns)	V
PGND	V _{PGND}	-0.3, 0.3	V
Thermal Resistance Junction-to-Ambient (0 lfpm)	R _{θJA}	90	°C/W
Thermal Resistance Junction-to-Case (0 lfpm)	R _{θJC}	15	°C/W
Operating Ambient Temperature Range	T _A	-40 to + 85	°C
Operating Junction Temperature Range	T _J	-40 to + 150	°C
Storage Temperature Range	T _{stg}	-55 to +150	°C
Power Dissipation	P _D	1.4	W
Moisture Sensitivity Level	MSL	1	-

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

DETAILED OPERATING DESCRIPTION

General

The NCP5252 is a PWM regulator intended for DC–DC conversion from 5 V & 12 V buses and supplies up to a 2 A load. The NCP5252 is a step down synchronous–rectifier buck topology regulator with integrated high–side and a low–side NMOS switches. The output voltage of the converter can be precisely regulated down to 600 mV \pm 1.0% when the V_{FB} pin is tied to V_{OUT} . The switching frequency can be adjusted to 333 kHz, 500 kHz, or 1 MHz. A skip mode can be enabled to provide light load efficiency.

The NCP5252 includes the following features: power good monitor, internal soft–start, cycle–by–cycle current limit, short circuit protection, output undervoltage/overvoltage protection, and thermal shutdown.

Control Logic

During start–up the internal LDO is activated and power–on reset occurs which resets the logic and all protection faults. The device will begin its start up sequence and the functionality will be determined by the voltage at the EN/SKIP pin. When voltage of EN/SKIP is below $V_{EN_DISABLE}$, the converter will shut down. If the voltage of EN/SKIP is set between V_{EN_FPWM} and V_{EN_SKIP} , the device will be in PWM mode of operation. When the voltage level of EN/SKIP is above V_{EN_SKIP} , the device will operate in PFM power saving mode. Once V_{REF} reaches its regulation voltage, an internal signal will wake up the output undervoltage supply monitor which will assert a “GOOD” condition. In addition, the NCP5252 continuously monitors the V_{CC} level with an undervoltage lockout (UVLO) function.

Forced PWM Operation (FPWM Mode)

To place the device into force PWM mode, the EN/SKIP pin voltage should be set between V_{EN_FPWM} and V_{EN_SKIP} thresholds. During the soft–start operation, the NCP5252 will automatically run as FPWM mode until the output voltage is higher than the internal soft–start ramp.

In FPWM mode in each switching cycle, the high–side MOSFET turns on for a time period defined by the ratio of input voltage to output voltage known as duty ratio. After a short period of time following high–side MOSFET turn off, the low–side MOSFET turns on and remains on for the remainder of the switching cycle. At currents below the critical conduction point, the low–side MOSFET will sync current out of the output capacitor, reducing overall converter efficiency at light loads.

Pulse Skipping Operation (Skip Mode/PFM)

The device operates in skip mode if the EN/SKIP pin voltage is greater than 2.9 V. Skip mode can reduce the switching loss in light load conditions.

When the converter inductor current is greater than the critical conduction point, the converter will run in continuous–conduction–mode (CCM) which behaves exactly the same as FPWM mode. When the inductor current

crosses zero from positive to negative, the low–side MOSFET is shut off so that current is not pulled out of the output capacitor. A high–side MOSFET turn on is not initiated until the COMP voltage exceeds the bottom of the PWM ramp.

Transient Response Enhancement (TRE)

To improve transient response in CCM, a transient response enhancement circuitry is implemented inside the NCP5252.

In CCM operation, the controller continuously monitors the COMP pin voltage of the error amplifier and detects load transient events. The functional block diagram of TRE is shown as follows:

Figure 25. Block Diagram of TRE Circuit

If a large transient occurs, the COMP signal will exceed the comparator threshold indicating that a transient has occurred and action is required. When the comparator trips an extra high–side pulse is generated and the converter appears to run at a higher frequency. Once the transient has passed, the converter returns to normal operation and normal switching frequency.

Voltage Feed Forward

The NCP5252 has a voltage feed forward derived ramp. Voltage feed–forward is employed to ease loop compensation for wide–input–range designs and provide better line transient response. The ramp generator provides voltage feed–forward control by varying the PWM ramp slope with line voltage. One important thing to note is that since the slope changes with the input voltage, the ramp height will also change, resulting in an almost constant gain over input voltages. Varying the PWM ramp directly with line voltage provides excellent response to line variations, because the PWM is not required to wait for loop delays before changing the duty cycle.

The peak to peak ramp voltage can be calculated using the following equation:

$$V_{RAMP_PP} = 0.25 \cdot V_{IN}$$

Overcurrent Protection (OCP)

The NCP5252 will protect the system if an overcurrent event occurs. The regulator will continuously monitor the output current through the internal MOSFETs. If the high–side MOSFET current exceeds the internal current limit threshold, it will be turned off. If a repetitive overcurrent event occurs, both MOSFETs will be turned off and the device will hold for 3 normal soft–start periods

NCP5252

before re-starting. A discharge resistor is turned on to discharge V_o before re-starting.

Overvoltage Protection (OVP)

When the SMPS output voltage is above 115% (typ) of the preset nominal regulation voltage for over 1.5 μ s, an OV fault is set. The high-side MOSFET will turn off and the low-side MOSFET will be turned on to discharge the output until V_o drops below the default threshold (105%). Once the output voltage is below the overvoltage window, the device will recover to normal operation.

Undervoltage Protection (UVP)

A UVP circuit monitors the output voltage to detect an undervoltage event. The undervoltage limit is 80% (typ) of the nominal output voltage level. If the output voltage is below this threshold for over 4 switching cycles, a UVP fault is set. The high-side and low-side MOSFETs are turned off and a discharge resistor is turned on to discharge the output

voltage for 3 soft-start periods. Once the 3 soft-start periods have ended, the regulator will go through a normal soft-start cycle.

LDO Regulator

The internal LDO regulator (V5) can provide up to 20 mA (typ) for internal analog circuitry. Connect a capacitor to pin V5 for proper regulation.

Undervoltage Logout

The UVLO circuit will activate when the V_{CC} voltage is below 3.5 V (typ). At that time both MOSFETs will turn off. When the V_{CC} voltage is higher than 4.0 V, the UVLO flag will be cleared and the soft-start function will activate.

Thermal Shutdown

The IC will shutdown if the die temperature exceeds 150°C. The IC will restart with soft-start operation only after the junction temperature drops below 125°C.

PACKAGE DIMENSIONS

QFN16, 3x3, 0.5P
CASE 485G
ISSUE F

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS.
3. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.25 AND 0.30 MM FROM TERMINAL.
4. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

*For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.
